Time allowed: 1 hour 35 minutes

Subject code **0610**

Biology

Questions from Paper 3, Paper 4 and Paper 6

You must have: a ruler marked in centimetres and millimetres, a protractor, compasses, a pen, an HB pencil and an eraser.

Total marks

/ 92

Instructions

- Answer every question in the space provided on this paper.
- Write in black or dark blue ink. Pencil may be used for diagrams and graphs.
- Fill in your name, centre number and candidate number above.
- Show your working: a correct method can earn marks even if the answer is wrong.

Information

- This paper has 10 questions worth 92 marks in total.
- The marks for each question or part are shown in brackets, for example [3].

Advice

- Read every question through once before you write anything.
- Use the marks in brackets to judge how long to spend on each part.
- If you finish early, go back and check your working.

Print at 100% (Actual size) so diagrams keep their real measurements.

1 This question is about photosynthesis.

Complete the sentences using words from the list.

Each word may be used once, more than once or not at all.

chlorophyll	**chloroplast**	**epidermis**	**glucose**
glycogen	**membrane**	**palisade**	**starch**
stigma	**stomata**		

When plants carry out photosynthesis the chemical called ..... traps light energy.

The energy is used to combine raw materials to make ..... .

This process mainly happens in the ..... layer of the leaf.

The gas needed for photosynthesis enters the leaf through the ..... .

These are found in the ..... of the leaf.

Leaves appear green because they contain the chemical called ..... .

3 A student investigated photosynthesis in a variegated leaf.

A variegated leaf has a green part that contains a green pigment and a white part that does not contain the green pigment.

Fig. 2.1 is a photograph of some variegated leaves.

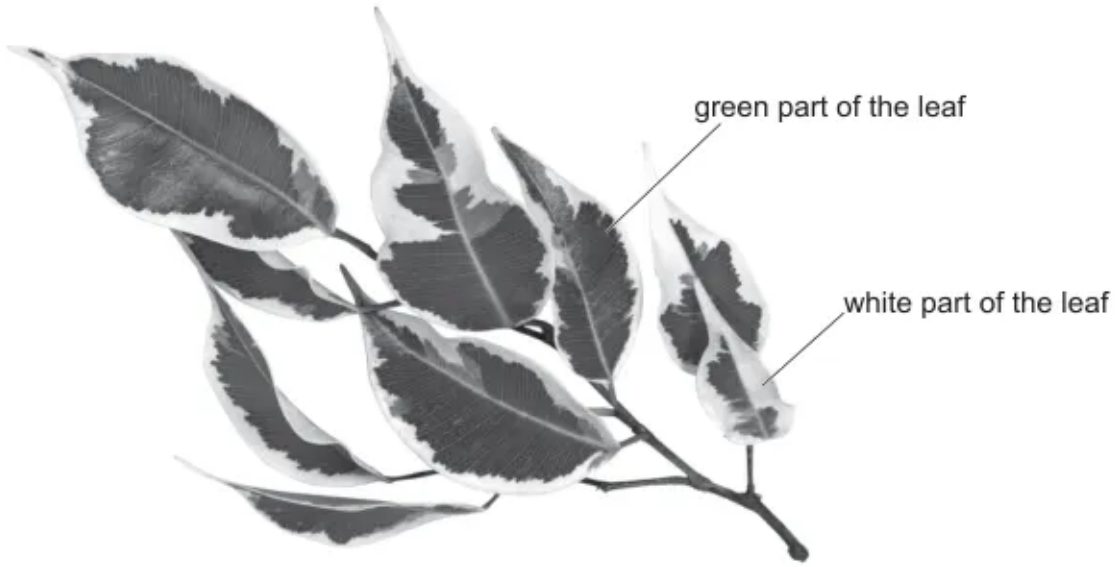

Fig. 2.1

(a) State where the green pigment is found in a plant cell.

..... [1]

STEM | Exam Builder

(b) A student investigated a variegated leaf from a plant that had been kept in the light for 24 hours.

The student prepared the leaf by boiling it and then placing it in ethanol to remove the green pigment.

The student then tested the leaf with iodine solution.

Table 2.1 shows the results.

Table 2.1

part of the leaf	colour with iodine solution
green	blue-black
white	yellow-brown

Explain the results shown in Table 2.1 for the white part of the leaf.

.....

.....

.....

.....

.....

.....

..... [3]

(c) This investigation was repeated with a plant that was kept for 24 hours in an environment where all the carbon dioxide was removed.

Complete Table 2.2 to predict the results.

Table 2.2

part of the leaf	colour with iodine solution
green	
white

STE

(d) **(i)** The boxes on the left show the names of some substances that are made in plants.

The boxes on the right show uses of these substances in plants.

Draw lines to link each substance with its correct use in plants. Draw **three** lines.

substance	use in plants
	to attract insects for pollination
cellulose	
	to build cell walls
nectar	
	for transpiration
sucrose	
	for transport in the phloem

[3]

(ii) List the chemical elements contained in carbohydrates.

4 Fig. 3.1 shows a photograph of some leaves on a tree.

Fig. 3.1

(a) State **two** features of the leaves, **visible** in Fig. 3.1, that are adaptations for photosynthesis.

1 .....

2 .....

[2]

(b) Fig. 3.2 is a diagram of part of a cross-section of a leaf.

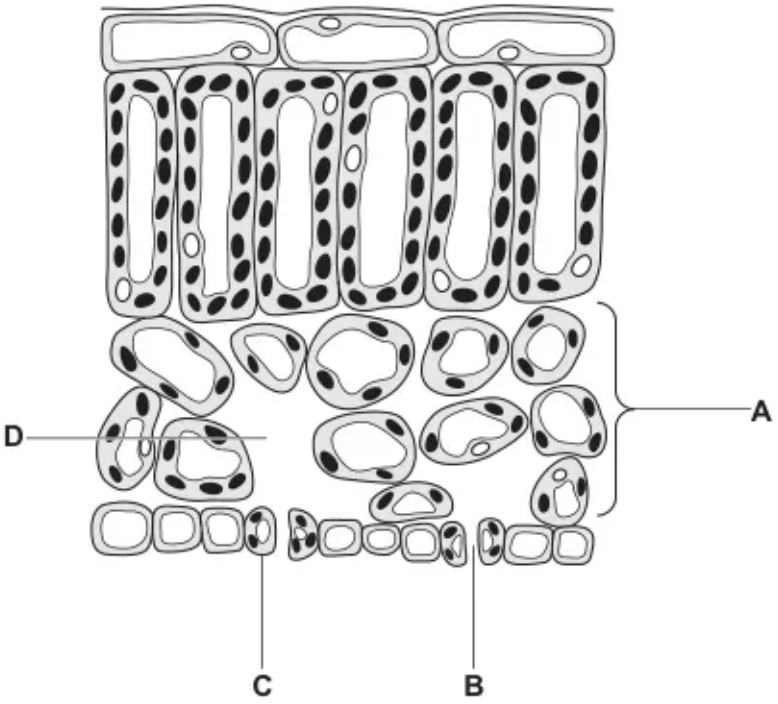

Fig. 3.2

(i) Explain how the parts of the leaf labelled **A**, **B**, **C** and **D** in Fig. 3.2 adapt the leaf for gas exchange during photosynthesis.

.....

.....

.....

.....

.....

.....

.....

.....

..... [4]

(ii) State the name of the mineral ion that plants need to make chlorophyll.

..... [1]

(c) Complete the sentences about transport in plants.

Leaves contain ..... bundles.

The xylem in the bundles provides plants with support and transports water and

..... from the ..... to the leaves.

Phloem in the bundles transports ..... and amino acids.

5 Many growers of crops in glasshouses use carbon dioxide enrichment to improve yields.

(a) Explain the advantages of carbon dioxide enrichment of glasshouses.

.....

.....

.....

..... [2]

Fig. 3.1 shows the carbon dioxide concentrations inside three glasshouses, **D**, **E** and **F**, on a hot day with bright sunlight.

- Glasshouses **D** and **E** received carbon dioxide enrichment and were ventilated by opening the windows.
- Glasshouse **F** did not receive any extra carbon dioxide and the windows were closed.

The carbon dioxide concentrations in the glasshouses and in the atmosphere were measured. The concentration in the atmosphere was 0.039 %.

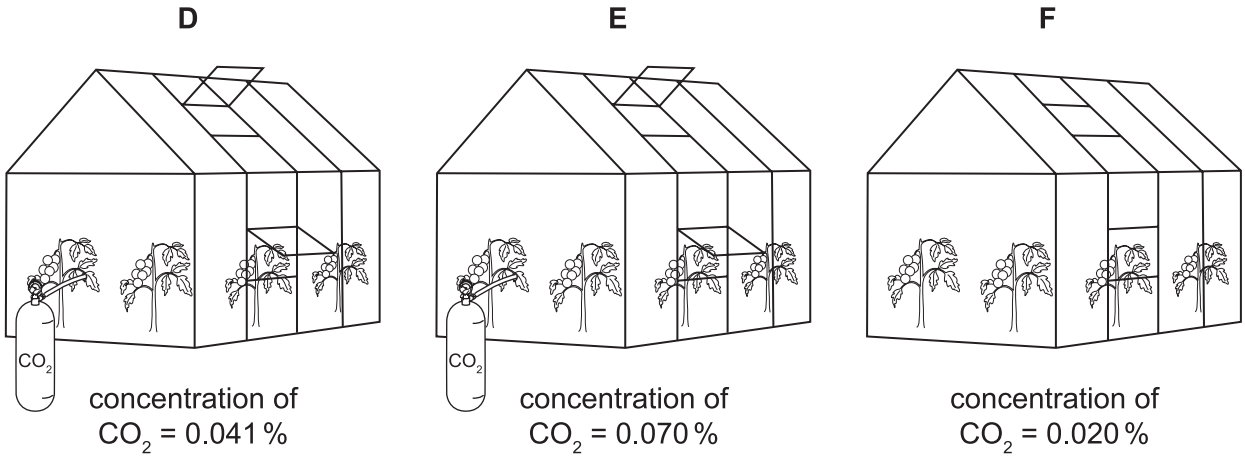

Fig. 3.1

The rate of uptake of carbon dioxide by the crop plants was measured in grams of carbon dioxide absorbed per square metre of glasshouse per hour. These results are shown in Table 3.1.

Table 3.1

glasshouse	rate of uptake of carbon dioxide by crop plants / g per m^2 per hour
D	2.5
E	5.7
F	1.0

STEM Exam Builder

(b) Suggest why it may **not** be cost effective to maintain a high concentration of carbon dioxide in glasshouse **E** compared to the concentration of carbon dioxide in the atmosphere.

.....

.....

.....

.....

.....

..... [2]

(c) **(i)** Concentrations of carbon dioxide in all three glasshouses in Fig. 3.1 increased at night. State why this happened.

.....

..... [1]

(ii) Explain why it is important to ventilate glasshouses by opening the windows.

STEM | Exam Builder

(b) In an experiment, thale cress plants (*Arabidopsis thaliana*) were grown in normal atmospheric and high carbon dioxide concentrations. The transpiration rate, the mean number of chloroplasts per cell and the concentrations of starch and magnesium ions were measured.

The results are shown in Table 2.1.

Table 2.1

factor measured	normal carbon dioxide concentration	high carbon dioxide concentration
transpiration rate / AU	8.1	5.6
mean number of chloroplasts per cell	8	11
concentration of starch / μg per mg of leaf	38	67
concentration of magnesium ions / mg per g of leaf	2.7	2.3

Complete the sentences about the data shown in Table 2.1.

Table 2.1 shows that increasing the carbon dioxide concentration caused more starch to be produced in the leaves. This shows that, at a normal carbon dioxide concentration, carbon dioxide is a ..... for photosynthesis.

During photosynthesis, ... molecules of carbon dioxide are required to make one molecule of glucose.

The greater quantity of starch stored in the leaves grown in a high carbon dioxide concentration means, when needed, more sucrose can be produced for transport in the phloem, so the leaves act as a ..... .

The greater number of chloroplasts per cell in the leaves grown in the higher carbon dioxide concentration means that more energy can be absorbed from ..... and transferred to ..... energy.

The transpiration rate is lower when the carbon dioxide concentration is higher. This means reduced loss of ..... from the leaves.

Magnesium ion concentration is lower in these leaves because they have used the magnesium ions to make ..... .

10 Hydrogencarbonate indicator can be used to determine the concentration of carbon dioxide in a solution. The table shows the colour of the indicator at different concentrations of carbon dioxide.

carbon dioxide concentration	hydrogencarbonate indicator colour
high	yellow
medium	red
low	purple

Aquatic plants photosynthesise and use up carbon dioxide when in the light. Aquatic plants respire and produce carbon dioxide in the light and in the dark.

When the carbon dioxide produced is equal to carbon dioxide used, hydrogencarbonate indicator is red.

Using an aquatic plant, plan an investigation to determine the light intensity at which the rate of photosynthesis is equal to the rate of respiration.
